Airway Superglottic

Kendall Combitube

Esophageal/Tracheal Double Lumen Airway for Emergency or Difficult Intubation.

- Blind placement without laryngoscope
- Unique design provides patient airway with either esophageal or tracheal placement.
- Reduces risk of aspiration of gastric contents.
- Requires no restraining devices.
- Single patient use.
- Kit includes syringes and suction catheters.
- Packaged non-sterile.

Combitube®

Esophageal/Tracheal Double-Lumen Airway

Rapid intubation of difficult airways.

When a difficult airway must be established, time and accuracy are critical. Now you can be assured of rapid intubation and effective ventilation with the **Combitube®** Esophageal/Tracheal Double-Lumen Airway from Nellcor. Unlike traditional endotracheal tubes, the **Combitube** airway is designed to establish a nonsurgical patient airway when placed into either the trachea or the esophagus.

Insert the **Combitube** airway blindly into the mouth. Advance gently until the teeth or alveolar ridges are aligned between the two black rings.

Inflate Line 1 through the blue pilot balloon leading to the large pharyngeal cuff with 100 mL of air for the 41 French or 85 mL of air for the 37 French, using the large syringe provided. Inflate Line 2 through the white pilot balloon leading to the smaller distal cuff with approximately 15 mL of air for the 41 French or 12 mL of air for the 37 French, using the small syringe provided.

Since an esophageal placement of the **Combitube** airway is most likely, begin ventilation by attaching the ventilating device to the longer blue connecting tube marked No. 1. If auscultation of breath sounds is positive, indicating esophageal placement, continue ventilation. If esophageal placement is confirmed, the second clear connecting tube marked No. 2 can be used for gastric suction with the suction catheter provided.

If auscultation of breath sounds is negative, a tracheal placement has been accomplished. The ventilation device should then be connected to the shorter clear connecting tube marked No. 2. The **Combitube** airway is then functioning as a normal tracheal tube.

- Unique double-lumen design allows for rapid airway establishment through either esophageal or tracheal placement.
- Blind placement eliminates the need for laryngoscope.
- Pharyngeal balloon holds device firmly in place and helps prevent the escape of gas through the nose or mouth.
- Full-length lumen allows for suctioning of gastric contents with no interruption of ventilation in the event the **Combitube** airway is placed in the esophagus.
- Esophageal cuff inflates to seal the esophagus so gas does not enter the stomach and gastric contents are not aspirated.
- Appropriate for prehospital, surgical and emergency use.

Rusch EasyTube® Double Lumen Tube

DESIGNED FOR DIFFICULT TRACHEAL OR ESOPHAGEAL INTUBATION

The Rusch EasyTube® is a dual lumen tube designed for difficult or emergency airway intubation and ventilation. The Rusch EasyTube creates a viable airway whether it is placed in the trachea or in the esophagus. When placed in the esophagus, the Rusch EasyTube allows the use of fiber-optic devices, or passage of a suction catheter or tube exchanger. The risk of tracheal trauma is reduced to a minimum due to the single lumen at the distal tip. The complete Rusch EasyTube® set includes tube, syringes pre-filled with air, and an extra length suction catheter. Packaged in a convenient roll-up kit.

- Single lumen at distal tip
- High-volume low-pressure PVC cuff at distal end
- Soft, latex-free cuff
- Allows for the use of fiber optic devices, suction catheters, or tube exchangers through second lumen
- Special placement rings
- Large volume syringe, pre-filled with air for the pharyngeal cuff
- Small volume syringe, pre-filled with air for the distal cuff

Airway Guard

Airway Guard is a bite blocker that is inserted on either side of the breathing tube. The **Airway Guard** fits between the upper and lower teeth on the sides of the mouth and maintains a 15 mm gap between the upper and lower jaws. This gap prevents the teeth from clenching together and occluding the passage of air through the tube.

Airway Guard is made of Polypropylene, an FDA approved plastic material. It is latex free and is for single use only. It consists of a body and a flange that is attached to the outer surface of the body. The body of the **Airway Guard** is placed between the upper and lower teeth. It is contoured to fit the dental arch. The flange remains at the lips to prevent the device from sliding inside the mouth. The **Airway Guard** is designed to attach to the breathing tube for added stability and airway protection.

How to Insert Airway Guard:

After proper placement of the endotracheal tube or laryngeal mask airway (LMA), separate the upper and lower jaws and place **Airway Guard** on either side of the breathing tube. If placed correctly, the tapered end should lay between the upper and lower molars and the flange should rest outside the lips to prevent the **Airway Guard** from sliding inside the mouth. Before securing the device, make sure the lips are clear and not pushed against the teeth or flange.

After **Airway Guard** is positioned correctly, engage the breathing tube inside the notch provided on the flange. To avoid accidental extubation you may tape the tube and the **Airway Guard** to the patient's face for added stability.

This device should be handled only by professionals trained in airway management.

Bronchoscopy and Gastroscopy:

To avoid bite damage to Bronchoscope or Gastroscope, place Airway Guard on the side of the mouth in the usual manner and secure with a tape across the face. Introduce the scope through the appropriately sized notch.

Sizes:

The **Airway Guard** is available in multiple sizes to fit either an LMA or endotracheal tube. The LMA sizes are marked 3, 4 and 5. The ET tube sizes are marked ET7, ET8 and ET9. Since the ET tube sizes are very close; one size of Airway Guard may fit more than one size ET tube.

Airway Guard is manufactured in a clean environment, individually encased in plastic bags, labeled and packaged. It is considered clean but not sterile.

Cautions:

We recommend that this device not be used for patients with unhealthy teeth, multiple loose or multiple missing teeth. It should be used with care in patients with dental prosthesis.

Size (3) - Item #FV-LMA-3

It has the small body, notch diameter 15mm, notch opening 13mm.

Size (4) - Item #FV-LMA-4

It has the large body, notch diameter 15mm, notch opening 13mm.

Size (5) - Item #FV-LMA-5

It has the large body, notch diameter 17mm, notch opening 15mm.

The above sizes fit the corresponding (LMA) size.

All Packaged 100/Box

Size (7) - Item #FV-ET-7

It has the small body, notch size 9mm, notch opening 7.5mm.

Size (8) - Item #FV-ET-8

It has the large body, notch size 10mm, notch opening 8.5mm.

Size (9) - Item #FV-ET-9

It has the large body, notch size 11mm, notch opening 9.5mm.

The above 3 sizes are for (ET) tubes. Since the difference in the (ET) tube sizes is very small, each Airway Guard size can fit same size tube, one size above and one size below. For example, Airway Guard size (8) can fit size 8, 7.5 and 8.5 (ET) tubes.

MERCURY® COLOR-CODED ORAL AIRWAYS

International color-coding provides instant identification of size.

SPECIALTY AIRWAYS

Williams Airway Intubator (The Round Hole Airway)

The airway intubator is cylindrical on the proximal half and open on the distal half of the lingual surface. Uses include a means of intubating the trachea, an oropharyngeal airway or a guide for fiber optic laryngoscope placement.

Packaged 10/Pkg

#19-00485 9 cm for adult females. Recommended for use with up to 7.5 mm I.D endotracheal tubes.

#19-00486 10 cm for adult males. Recommended for use with up to 8.5 mm I.D endotracheal tubes

Epistaxis Airway Dr. H. Masing pattern, inflatable nasal tube

Controls severe hemorrhage in the nasal cavity and bilateral stabilization of the bony cartilaginous structure after fracture of the nose. Designed for gentle hemostasis of the nose and nasopharynx. The anatomically contoured cuff is made of silicone-latex. The presence of silicone results in minimal adherence to the mucus membranes and a traumatic removal.

Patil Intubation Oral Airway

Patil-Syracuse Oral Airway	Size 2	#19-00-492
Patil-Syracuse Oral Airway	Size 4	#19-00-494

Used in conjunction with the Patil-Syracuse mask, permits endoscopy in anesthetized patients with minimal interference with ventilation.

Airways/Nasopharyngeal

Original Style "Blue" Robertazzi Nasopharyngeal Airways

"BLUE" LATEX ROBERTAZZI

Features

- Nine sizes available: 30-36FR
- Sterile
- Best Quality
- Smooth surface for easy insertion
- Accurate sizing of airway
- Soft - to reduce trauma to nasal passage
- Flexible
- Resists collapse or kinking
- Resilient
- Process to reduce latex protein

Nasopharyngeal Airways

Sun●Med Healthcare is pleased to announce our original "Blue" latex nasopharyngeal tubes have been improved through a unique manufacturing process. All nine sizes are treated to provide an extremely smooth surface to accommodate the patient's comfort and easing of insertion and removal.

To reduce undesirable proteins, a proprietary three-step procedure is employed prior to sterilizing this product, removing antigenic protein inherent to all natural latex.

TEST I: ASTM D 5712 TOTAL PROTEIN (LOWRY)

A total protein Lowry Assay test has been obtained on our nasopharyngeal tubes indicating less than 50ug/g total protein.

TEST II: ASTM D 64499-00 ANTIGENIC PROTEIN

The newer, more specific Elisa test to determine the antigenic protein level has determined our nasopharyngeal tubes have less than 0.6ug/g antigenic protein. The above analyses were carried out by Guthrie Research Institute and certified to Sun●Med Healthcare by Akron Rubber Laboratory Inc., both the Lowry Assay and the Elisa test results are available upon request.

Latex Free Nasopharyngeal Airways

ROBERTAZZI STYLE

Latex free nasopharyngeal airways have the same characteristics as the popular "Blue Latex" airway, in softness and flexibility.

- Latex free
- Soft - no damage to nasal passage
- Flexible
- Resists collapse or kinking
- Resilient
- Nine sizes available: 20-36FR
- Sterile & disposable

ADJUSTABLE AIRWAY

- Soft moveable flange
- 13 sizes 12-36FR
- Latex free

		#12-1233-36	36F	10

Nasopharyngeal Airways are made of a soft, compliant PVC which conforms readily to nasopharyngeal anatomy. Maximum kink-resistance helps assure a patent airway and the satin-smooth finish facilitates insertion. The smoothly rounded edges provide increased patient comfort and safety. The nasopharyngeal airways are supplied sterile in an easy-to-open blister basin package.
